# Introduction to Text Input and Output

---

*Text Input and Output* describes how to use the Cocoa's text system's built-in support for storing text in files.

## Who Should Read This Document

You should read this document if you need to understand how to read and write text files from Cocoa text objects.

## Organization of This Document

This document includes the following articles:

- ["Text Input and Output Formats"](#) (page 9) describes the file formats that the text system can read and write.
- ["Using Text Input and Output"](#) (page 11) presents code fragments that illustrate how to read and write text files from an `NSTextView` object.

## See Also

For more information, refer to the following documents:

- *Attributed Strings Programming Guide* describes the `NSAttributedString` objects that manage sets of text attributes, such as font and kerning, associated with character strings in rich text.
- *Text Attributes* describes the text-related attributes maintained by the Cocoa text system.
- *Text Attachment Programming Topics for Cocoa* discusses the way the text system handles text attachments stored in the RTFD file format.

# Text Input and Output Formats

---

The text system provides a convenient interface to the file system that enables you to read, display, and write files in the text formats described in Table 1.

**Table 1** Text system input and output formats

Format	Description
Plain Text	Characters unaccompanied by attribute information.
Rich Text Format (RTF)	Character and attribute information expressed in Rich Text Format (RTF). See the <i>Rich Text Format (RTF) Specification</i> by Microsoft Corporation for more information.
Rich Text Format Directory (RTFD)	Character and attribute information expressed in Rich Text Format and stored in a directory along with the images and other attachments that are embedded in the text.

# Using Text Input and Output

---

This article shows you how to read text from a file into an `NSTextView` and how to write text to a file from an `NSTextView`.

## Reading Text From a File

To read text from a file, you first must determine the format of the text. To illustrate how this is done, consider an object of the custom class `Controller`. A `Controller` object is responsible for opening and closing files. It stores an `NSTextView` object and declares a variable that records the format of the text that it reads in. Here's the interface declaration:

### Listing 1 Determining the text format

```
#import <AppKit/AppKit.h>
typedef enum _dataFormat {
    Unknown = 0,
    PlainText = 1,
    RichText = 2,
    RTFD = 3,
} DataFormat;

@interface Controller : NSObject
{
    DataFormat theFormat;
    NSTextView *theTextView;
}
- (void)openFile:(id)sender;
- (void)saveFile:(id)sender;
@end
```

Now, the `Controller` object's `openFile:` method can be implemented like this:

### Listing 2 Reading the text from a file

```
- (void)openFile:(id)sender
{
    NSOpenPanel *panel = [NSOpenPanel openPanel];
    if ([panel runModal] == NSOKButton) {
        NSString *fileName = [panel filename];
        if ([[fileName pathExtension] isEqualToString:@"rtfd"]) {
            [theTextView readRTFDFromFile:fileName];
            theFormat = RTFD;}
        else if ([[fileName pathExtension] isEqualToString:@"rtf"]) {
            NSData *rtfData = [NSData dataWithContentsOfFile:fileName];
            [theTextView replaceRange:
             NSMakeRange(0, [[theTextView string] length]) withRTF:rtfData];
            theFormat = RichText;
        }
    }
}
```

```

        } else {
            NSString *fileContents = [NSString
            stringWithContentsOfFile:fileName];
            [theTextView setString:fileContents range:NSMakeRange(0,
            [[theTextView string] length])];
            theFormat = PlainText;
        }
    }
}

return;
}

```

The `openFile:` method checks the file name returned by the Open panel for the extensions “rtfd” or “rtf” and uses the appropriate means of loading data for each type. Files having any other extension are loaded as plain text. Note that the Controller object records the format of the loaded data in its `theFormat` variable. This information is used to determine how the file should be saved, as discussed in the next section.

## Writing To a Text File

Depending on the format of an `NSTextView` object’s text, you use slightly different approaches to write the text to a file. For plain text, you extract the contents of the `NSTextView` as an `NSString` object and use the `NSString` method `writeToFile:atomically:` to write the data to disk. RTF text is treated similarly, except that the contents is extracted as an `NSData` object. Easiest of all is RTFD data, which the `NSTextView` itself knows how to write to a file:

### Listing 3 Writing text to a file

```

- (void)saveFile:(id)sender
{
    NSSavePanel *panel = [NSSavePanel savePanel];
    switch (theFormat) {
        case PlainText:
            [panel setRequiredFileType:@""];
            if ([panel runModal] == NSOKButton) {
                [[theTextView string] writeToFile:[panel filename]
                atomically:YES];
            }
            break;
        case RichText:
            [panel setRequiredFileType:@"rtf"];
            if ([panel runModal] == NSOKButton) {
                [[theTextView RTFFromRange:
                NSMakeRange(0, [[theTextView string] length])]
                writeToFile:[panel filename] atomically:YES];
            }
            break;
        case RTFD:
            [panel setRequiredFileType:@"rtfd"];
            if ([panel runModal] == NSOKButton) {
                [theTextView writeRTFDToFile:[panel filename]
                atomically:YES];
            }
            break;
        default:

```

```
        NSRunAlertPanel(@"Save Error",
                        @"Couldn't save file (unknown data format).\n",
                        nil, nil, nil);
    }
    break;
}
return;
}
```

# Document Revision History

---

This table describes the changes to *Text Input and Output*.

Date	Notes
2004-02-10	Renamed topic from <i>Text I/O</i> to <i>Text Input and Output</i> . Revised introduction and added an index.
2002-11-12	Revision history was added to existing topic. It will be used to record changes to the content of the topic.
